Assertions

- **The world is not short of renewable energy**
 - 6,200 km² of Sahara desert would produce all UK final energy needs
- **The world does require an energy vector**
 - Reliable and modestly priced to move this energy from its point of production/capture and transfer it to the consumer when it is required
- **Historically, storage has enabled transparent markets**
 - The separation of production from use improves the efficiency of both
- **Ideally the vector should not be poisonous, or of short life**
- **Ideally no greenhouse gas emissions at point of use**

Sahara

- Red square shows land area required for UK final energy needs at 300 kWh/m²/y

Options for energy vectors include

- **Electricity - a good vector but no storage**
- **Hot water/steam - expensive and complex to store.**
- **Methane with a biologically derived carbon atom (always risks food competition; the market moves in complex ways)**
- **Ammonia etc - technologically complex**
- **Hydrogen**

Hydrogen

- **Flammable, colourless, biologically inert gas burns to water**
- **Very light gas, density $\sim 0.08\text{kg/m}^3$ (about 1/8 methane, $\sim 0.67\text{kg/m}^3$)**
- **Low calorific value of about $12,750\text{kJ/m}^3$ (about 1/3 methane, $\sim 39,000\text{kJ/m}^3$)**
- **Good safety record with ~ 60 million tonnes per year produced, transported and used in industry.**
- **A long record as Towns Gas (50-65% hydrogen) both in the UK and still in the Far East**
- **Can be conveyed through repurposed existing MP and LP gas networks with change of appliance**

Hydrogen

- **The need for storage is encapsulated in the following numbers**

Average annual gas consumption UK property	kWh	18,750
Average daily gas demand	kW	2.14
Typical peak daily winter demand	kW	10.00
Typical daily summer demand	kW	0.33

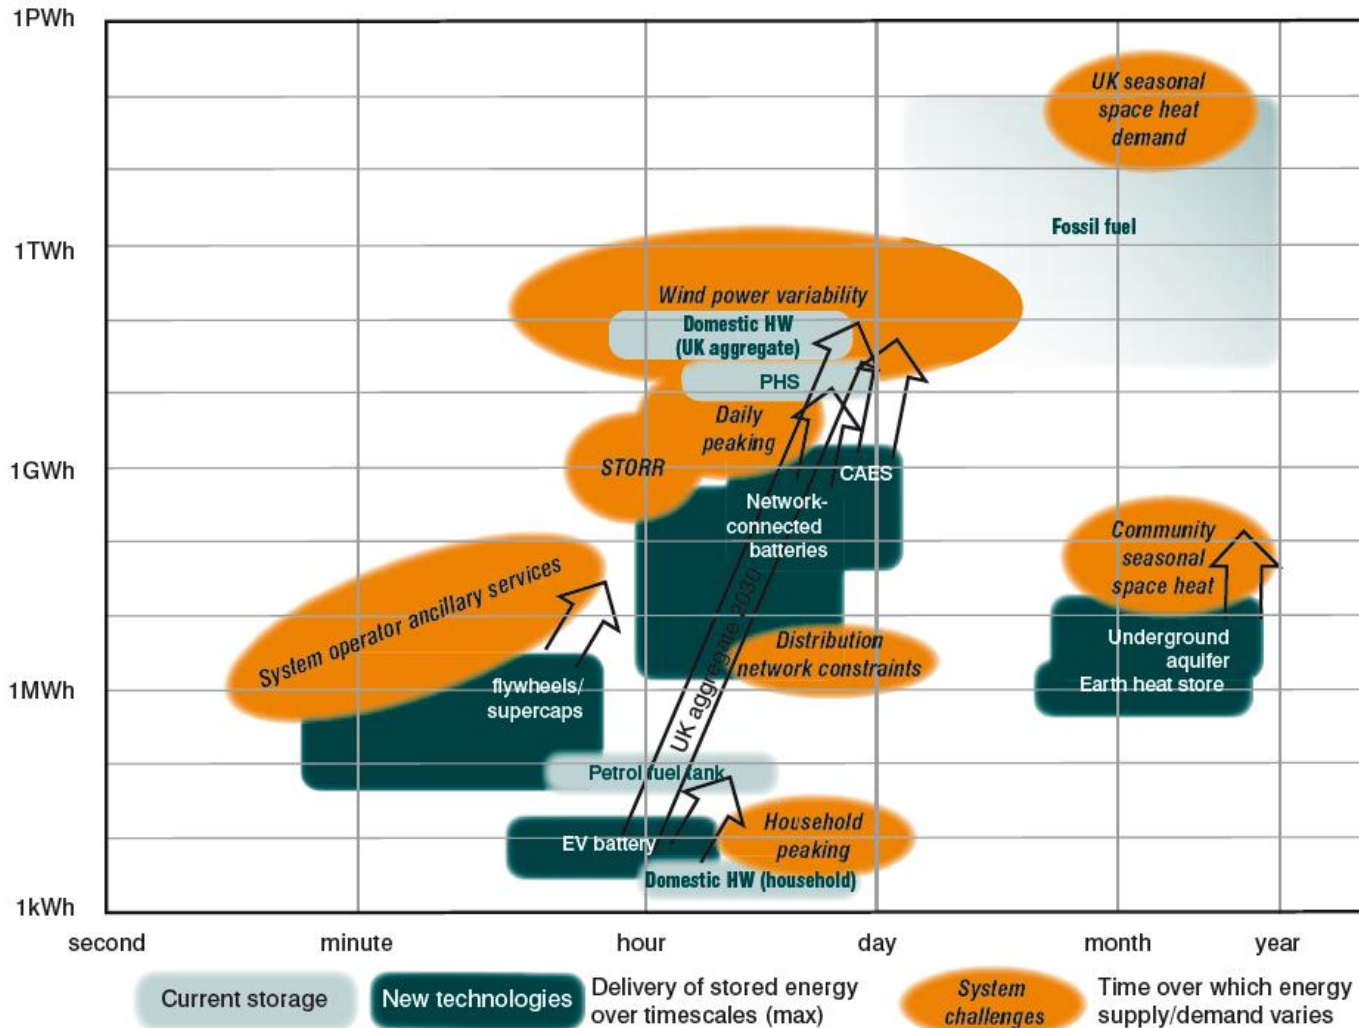

- **Even at a national scale there is large swing between summer and winter energy (gas) demand**

UK inter-seasonal variation in energy demand

■ 14 years energy demand

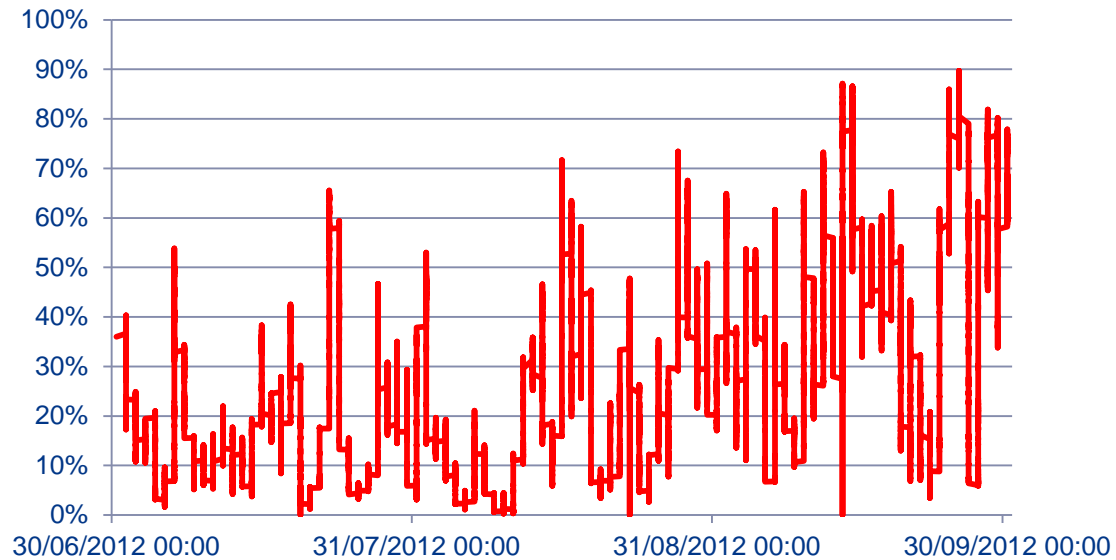

UK requirements for energy storage

Ref: http://www.energyresearchpartnership.org.uk/tiki-download_file.php?fileId=291 | Energy%20Storage%20Full%20Report.pdf

UK requirements for energy storage

■ Typical UK average wind intermittency

Relative space for 90 days of energy

Annual demand per property	kWh	18,750
Mean load	kW	2.14
Turbine yield		29%
Size of turbine	kW	7.38
Days storage		90
Required store	kWh	4,623
Options		
Mass of Hydrogen	kg	119
Hot water		
Upper temp	°C	75
Lower temp	°C	60
Delta T	°K	15
Mass of hot water storage	Tonnes	265

UK requirements for energy storage

- Hydrogen is particularly suitable for inter-seasonal down to daily load swings

Month	20 year average degree days	Degree hours	Demand	Production	Balance
Oct-10	174	4176	7%	11%	3%
Nov-10	258	6192	11%	11%	3%
Dec-10	360	8640	15%	11%	-2%
Jan-11	345	8280	14%	9%	-7%
Feb-11	300	7200	13%	9%	-11%
Mar-11	291	6984	12%	9%	-14%
Apr-11	219	5256	9%	6%	-17%
May-11	158	3792	7%	6%	-17%
Jun-11	87	2088	4%	6%	-14%
Jul-11	52	1248	2%	7%	-9%
Aug-11	54	1296	2%	7%	-4%
Sep-11	91	2184	4%	7%	0%
Total	2389	57336			

- This indicates monthly mismatch between central heating demand and monthly wind production
- Sized to meet annual demand

Effect of annual production on cost

- The higher the capital cost (e.g. nuclear power) the greater the effect
- Value of storage in this instance 0.17p/kWh

Biomass plant	£ 2,600	£/kW
Cost of biomass	£ 0.020	£/kW
Electric efficiency	45%	
Cost of fuel to electric	£ 0.044	£/kW
Depreciation	20	years
O&M	4%	
Investor return	8%	
Annual cost	£ 442	£/kW
Cost of electricity		
7500hours/y Note 1	£ 0.10	£/kWh
2000hours/y Note 2	£ 0.27	£/kWh

Note 1: Approximate base-load design

Note 2: Upper end of hours to provide electric space heating + DHW

By Electrolysis

- By electrolysis from renewable sources e.g. this electrolyser operates at an efficiency of around 80% (including ancillary power consumption)

Hydrogen Storage

1 * Energy storage cavern in Texas =
50 * Cruachan pumped storage schemes

<http://www.oban.org.uk/listing/Cruachan-Power-Station>

Hydrogen Storage

- **Compressed underground hydrogen storage is entirely proven and new sites are under-construction today e.g. PRAXAIR in Texas**

Hydrogen caverns are operated in

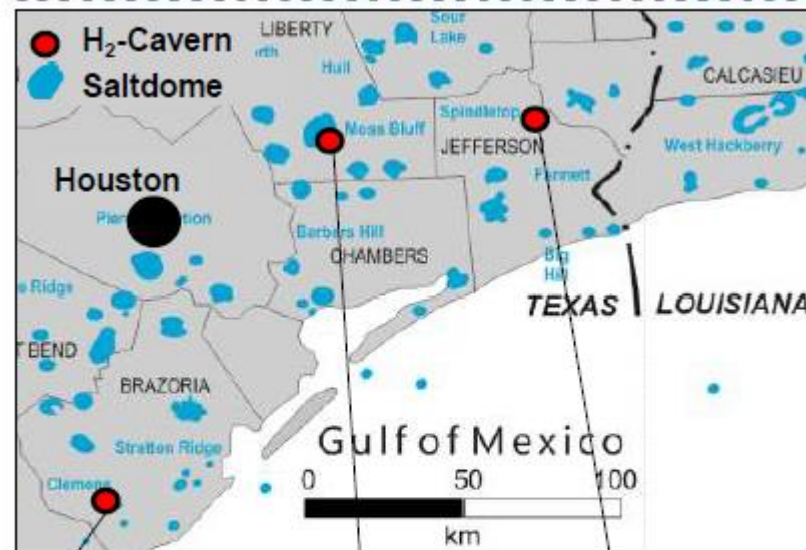

- Teesside, UK, by Sabc Petrochemicals (3 x 70,000 m³)
- Clemens Dome, Lake Jackson, Texas, U.S., by ConocoPhillips (580,000 m³)
- Moss Bluff salt dome, Liberty County, Texas, U.S., by Praxair (566,000 m³ maximum permitted capacity)

- **This last facility has the capacity of up to 65,000toe or >50 Cruachan pumped storage stations**

Hydrogen Storage

Salt Caverns

- Salt caverns are solution mined cavities within either salt domes or bedded salts that do not match reservoir volume capacity.

Depleted Oil/Gas Reservoirs

- Depleted reservoirs are proven gas reservoirs that are easy to develop and operate due to existing infrastructure.

Aquifers

- Aquifers are similar in geology to depleted reservoirs, but have not been proven to trap gas and must be developed.

Ref:

<http://prod.sandia.gov/techlib/access-control.cgi/2011/114845.pdf>

Hydrogen Storage

- **Salt Cavern**
 - simplest and only commercially proven
- **Redundant Gas field**
 - will produce severe contamination of the hydrogen in early years
- **Aquifer**
 - may have significant technical problems with hydrogen loss
- **Unfortunately truly low cost hydrogen storage is currently driven by geological chance and is strongly dependent upon scale**

Indicative costs of storage

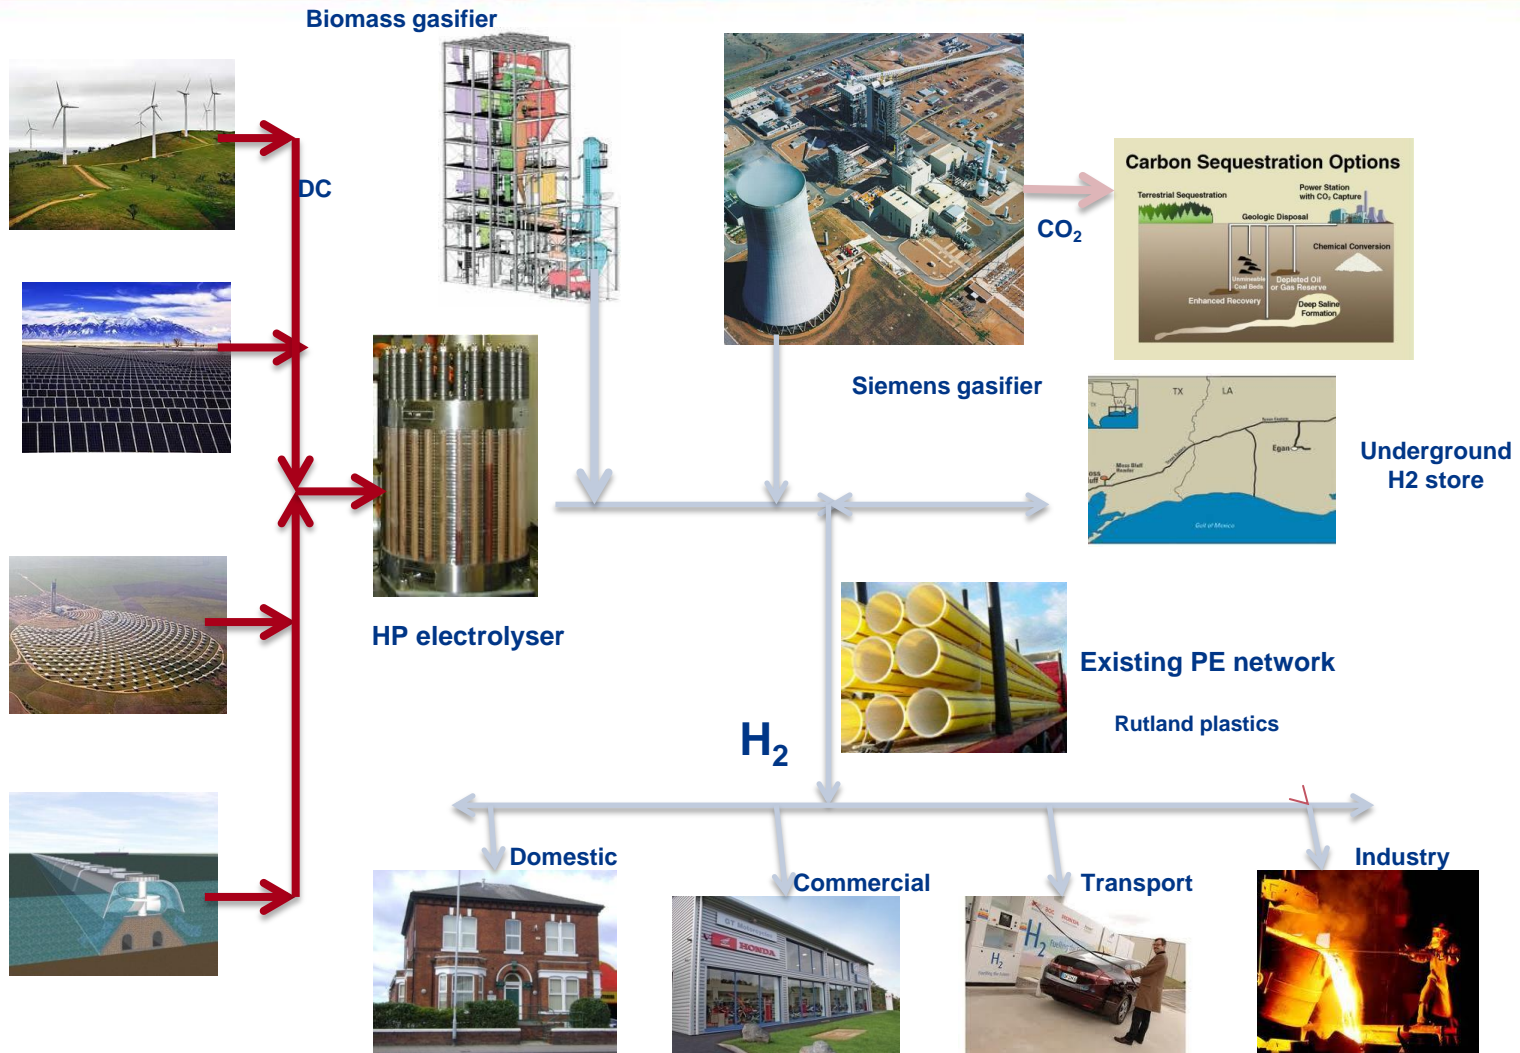

- This is about 1/4 to 1/10, the ‘value’ arising from the intermittent use of biomass generation (i.e. 0.17p/kWh)
- The surest route to reducing energy production cost is to increase operating hours of the producer and/or not restrict output

CURRENT STATE OF AND ISSUES CONCERNING
Underground Natural Gas Storage

	Upper	Lower
Methane Cap Cost \$	\$ 25,000,000.00	\$ 10,000,000.00
Depreciation 20 yrs	\$ 1,250,000.00	\$ 500,000.00
O&M 4%	\$ 1,000,000.00	\$ 400,000.00
Return 8%	\$ 2,000,000.00	\$ 800,000.00
Annual cost	\$ 4,250,000.00	\$ 1,700,000.00
Annual storage kWh	278,000,000	278,000,000
Annual \$/kWh	\$ 0.015	\$ 0.006
£/kWh	£ 0.010	£ 0.004
Hydrogen BY 4	£ 0.042	£ 0.017

Hydrogen Supply and Use Chain

Hydrogen Transport

Hydrogen Analysis Resource Center:

European Hydrogen Pipeline Miles by Country

Country	Miles
Belgium	381
France	188
Germany	242
Italy	5
Netherlands	147
Sweden	11
Switzerland	1
United Kingdom	25
Total	1001

Unit Cost of NG & H₂ Pipelines Vary with Pipe Diameter & Installation Technology

Diameter (inch)	Capital Cost of Natural Gas Pipeline (\$/mi)	Capital Cost of H ₂ Pipeline, Cut/Cover (\$/mi)	Capital Cost of H ₂ Pipeline, Trenchless (\$/mi)
3	\$200,000	\$400,000	\$300,000
9	\$500,000	\$900,000	\$700,000
12	\$600,000	\$1,000,000	\$900,000
14	\$800,000	\$1,400,000	\$1,150,000

Argonne National Laboratory
Transportation Technology R&D Center

- In summary the long distance transportation of hydrogen is well proven and cost competitive

Hydrogen

- **Hurdles to the current widespread development of hydrogen infrastructure with integral storage**
- **No overt method of valuing stored energy**
- **Currently natural gas producers do not charge additionally for intermittent demand. Hence the poverty of Natural Gas storage scheme coming forward**
- **Price of carbon too low and renewables too small a percentage of energy use to create a market for storage**
- **BUT the UK will require energy storage and hydrogen (next to pumped storage) the only proven technology**

Hydrogen: how to proceed

- Large schemes of co-production of hydrogen for power generation and static/transport use avoids any storage issues in the short term
- Produce low carbon hydrogen principally for power generation either from
 - SMR +CCS
 - Waste derived hydrogen
- Distribute swing production locally to establishing a local market for:
 - hydrogen in the static and transport sectors (Cars, buses etc)
 - boilers, fuel cells, gas fires and cookers
- Thus proving hydrogen's credentials as a low carbon vector

Hydrogen: how to proceed

- **Subsequently start to investigate time shifting of local networks by both their interconnection and inclusion of storage via**
 - Re-purposed natural gas or other hydrocarbon lines
 - New HP hydrogen lines

- **To**
 - existing redundant gas fields e.g. Cousland Scotland's first natural gas field
 - redundant off shore
 - newly washed out salt caverns

Hydrogen: how to proceed

- **In summary, hydrogen is ideal for local connections:**
 - Identify an enthusiastic LOCAL community (without gas?)
 - Build LOCAL hydrogen production on the back of power generation but with construction of local infrastructure for domestic (1000 houses), commercial and transport use
 - Interconnect LOCAL networks to each other and storage to provide a very level of community de-carbonisation, with hydrogen production operational either continuously (if nuclear or fossil plus CCS) or following the vagaries of renewable power.
